

How Many Watches / Bindings Is Too Many?

Some browsers are faster than others.
Older mobile browsers are slow.

Complex watches are more expensive than simple watches.

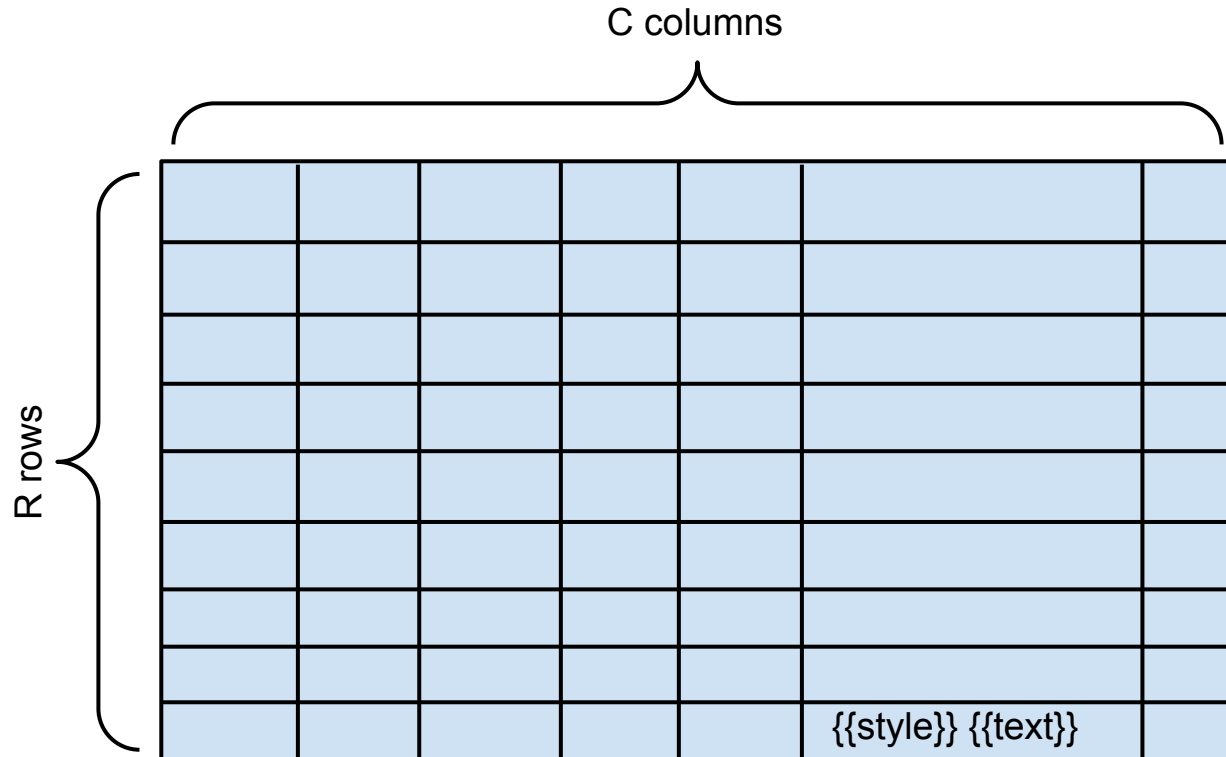

Guidelines:

100s = OK
1000s = SLOW

Hard to get in trouble with manually placed bindings.

Easy to get in trouble with (nested) ng-repeat.

An easy way to get in trouble: naive table/grid.

$R * C * 2$ watches per cell = total number of watches

Example: $100 * 20 * 2 = 4000$ watches = SLOW
